

Steps for using 'Addition Method'

- 1 Find the variable that will be easiest to eliminate (this takes practice and patience)
- 2 Take the coefficients of those variables and multiply them with the other equations (**make sure you end up with opposite signs**)
- 3 Add the equations straight up and down.
- 4 When you have a number, put it back into either one of the original equations.
- 5 Write your answer as an ordered pair.
